Hints for AVATAR (and some more)

Martin Suda

Czech Technical University in Prague, Czech Republic

PIWo 2019, Prague, October 2019

<□> < □> < □> < 三> < 三> < 三> 三 のへで 1/17

Some people actually use ATPs to do math!

Some people actually use ATPs to do math!

- e.g., Bob Veroff and Michael Kinyon
- using Otter, Prover9, Mace4
- questions from algebra: axioms bases for boolean algebras, ortho-lattices, loop theory

< □ > < □ > < □ > < Ξ > < Ξ > Ξ の Q · 1/17

• targeting open problems (e.g. the AIM conjecture)

Some people actually use ATPs to do math!

- e.g., Bob Veroff and Michael Kinyon
- using Otter, Prover9, Mace4
- questions from algebra: axioms bases for boolean algebras, ortho-lattices, loop theory
- targeting open problems (e.g. the AIM conjecture)

In what sense interactive?

- a single proof attempt (ATP call) usually does not solve it
- trying different formulations / axiomatizations
- trying various additional assumptions and learning from them

Some people actually use ATPs to do math!

- e.g., Bob Veroff and Michael Kinyon
- using Otter, Prover9, Mace4
- questions from algebra: axioms bases for boolean algebras, ortho-lattices, loop theory
- targeting open problems (e.g. the AIM conjecture)

In what sense interactive?

- a single proof attempt (ATP call) usually does not solve it
- trying different formulations / axiomatizations
- trying various additional assumptions and learning from them
- ➡ By the way, these attempts may run for weeks!

What is a hint?

- a clause supplied by the user as part of the input
- whenever a newly derived clause C subsumes a hint clause, this C is prioritized for selection

<□ > < □ > < □ > < Ξ > < Ξ > Ξ の Q C 2/17

What is a hint?

- ➡ Hints are a means for steering the proof search!

Where do hints come from?

- the (expert) user just thinks of some
- more realistically: clauses from proofs of similar theorems or of the same theorem but under different assumptions
- ➡ Hope that similar theorems can be proved using similar intermediate steps.

How to come up with hints automatically?

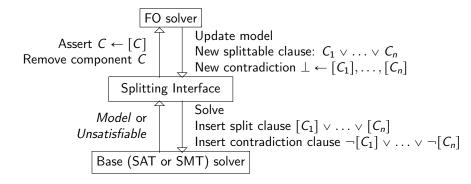

AVATAR [Voronkov'14]

- modern architecture of first order theorem provers
- integrates saturation with a SAT solver (or an SMT solver)
- efficient realization of the clause splitting rule
- <u>instead of one</u> monolithic proof search
 <u>a sequence</u> of proof searches on (much) smaller sub-problems

<ロ> < @ > < E > < E > E のQ (* 3/17

- implemented in theorem prover Vampire
- shown highly successful in practice

AVATAR architecture overview

Clause Selection and Age-weight Ratio

Vampire alternates between selecting the next given clause by age (old first) and by weight (light first) under a given ratio.

↓ □ ▶ ↓ □ ▶ ↓ ■ ▶ ↓ ■ ♡ Q ○ 16/17

Normally, this alternation is regular. What if we change it to probabilistic?

Clause Selection and Age-weight Ratio

Vampire alternates between selecting the next given clause by age (old first) and by weight (light first) under a given ratio.

Normally, this alternation is regular. What if we change it to probabilistic?

3 conduct experiments

Empirical research with an ATP:

- have a new idea
- implement (and debug)
- 3 conduct experiments

When are the results significant?

• improving overall performance (high total solved)

• solving hard problems ("the uniques")

Empirical research with an ATP:

- have a new idea
- implement (and debug)
- onduct experiments

When are the results significant?

- improving overall performance (high total solved)
- solving hard problems ("the uniques")

Why don't we use (carefully seeded) randomness to prove more theorems (without much actual extra thinking)?
